Preface

We are delighted to offer the readers of the journal the latest issue, which covers a wide variety of topics. Of course, the topic of COVID is a must for any biomedicine-related publication, and we have included a comprehensive review on the global scenario of this disruptive disease. On the other hand, in spite of the pandemics, there are many medical conditions that require urgent attention, such as psoriasis, which is the subject of other articles, including natural and nanotechnology-based alternatives. In this regard, the issue also contains some interesting reports on nano-phytomedicine for various diseases, along with anticancer treatments from plants, by using nanoscience and nanotherapeutics. Finally, the toxicity and efficacy of modified silver nanoparticles in mice models are reported in one of the articles. We hope that these contributions will not only be of interest to the community but will also motivate further research and development (R&D) in nanomedicine.
