EDITORIAL

Continuous advances in the field of Pediatrics and Neonatology require daily updating by the pediatrician. This CPR issue addresses this need with articles on critical areas of neonatal and pediatric care.

Recognizing the role of epigenetic factors in necrotizing enterocolitis is a valid aid for new diagnostic and preventive strategies for the disease. The current SARS-COV-2 pandemic is a continuous diagnostic and managerial challenge for the pediatrician that requires continuous updating.

A pediatrician requires clinical updating on topics such as atopic dermatitis and psoriasis, and reviews and guidelines serve as useful resources.

Unfortunately, there are still differences in treatment, even in palliative care, between low- and high-resource countries.

Finally, meta-analysis articles are also important to evaluate intriguing associations such as induction of labor and autism.

The "Epigenetics in Necrotizing Enterocolitis" by J. Nair and A. Maheshwari is a detailed review clarifying a highly complex topic.
