PREFACE

The pandemic of SARS-CoV-2, with the emergence of the highly contagious Delta and Omicron variants, points out that active research in the field of coronaviruses, as well as other infectious microbes and their associated diseases, is crucial. With the journal ‘Infectious Disorders – Drug Targets’ (ID-DT, we are actually at the forefront of this research by publishing the most recent and important research works and review articles in the field of microbes. As an Editor-in-Chief of ID-DT, I warmly thank the researchers and clinicians from all countries for their invaluable contribution to solve this long-lasting health crisis related to SARS-CoV-2 infection. I strongly encourage researchers and clinicians to submit their most important discoveries to ID-DT, which publishes research and review articles, letters, clinical trials and (guest-edited) thematic issues on the various aspects of coronaviruses and other microbes: origins, modes of action, transmission, pathogenesis, epidemiological, clinical and genomic characteristics. We are looking forward to receiving your next article submissions. I wish you, as well as the whole team of the journal ID-DT (and Bentham Sciences Publishers), a healthy, happy and prosperous new year 2022.

Jean-Marc Sabatier
